ABSTRACT

The structure, magnetic properties and magnetocaloric effects of perovskite manganese oxides $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ and $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$ have been investigated. They undergo a first-order ferromagnetic–paramagnetic phase transition around their respective Curie temperatures (235 K and 215 K, respectively). The doping of Eu and Sr atoms enhances greatly the value of magnetization, which leads to the large magnetocaloric effect. For a field change of 0–5 T, the maximum value of magnetic entropy change is only 4.5 J/kg K for $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ compound. However, it increases to 7.1 J/kg K for $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$ compound. Meanwhile, a large refrigerant capacity of 240.4 J/kg is also achieved. Large reversible magnetocaloric effect and refrigerant capacity indicate the potentiality of $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$ compound as a candidate for magnetic refrigerant.

1. Introduction

The magnetic refrigeration, based on the magnetocaloric effect (MCE), has attracted a lot of interest in recent years because of its advantages over the conventional gas compression refrigeration, particularly for higher efficiency, less energy consumption, and not using ozone-depleting or global-warming gases [1–3]. The magnetocaloric effect (MCE) is intrinsic to all magnetic materials and is due to the coupling of the magnetic sublattice with the magnetic field, which changes the magnetic part of the entropy of a solid [4]. So MCE becomes the maximum around the transition temperature of magnetocaloric materials [5]. Recently, large MCE near room temperature has been reported in many compounds with a first-order magnetic phase transition such as $\text{Mn}(\text{Fe,P})\text{As}$ [6], $\text{La}(\text{Fe,Si})_{13}$ [7], $\text{MnFe}(\text{P,Si,Ge})$ [8] as well as $(\text{La}_{1-x}\text{M}_x)\text{MnO}_3$ ($\text{M}=\text{Na, Ag, Ca, Sr, and Ba etc.}$) [9–13]. However, the hysteresis loss as well as the slow kinetics inherent in these materials may reduce the actual magnetocaloric efficiency. Therefore, it is desirable to find new materials with a large reversible MCE, especially at low magnetic fields and with a wide temperature range [14].

In the past few years, some authors have investigated the MCE in $\text{La}_{1-x}\text{Ca}_x\text{MnO}_3$ compounds and found that the magnetic entropy change of $\text{La}_{1-x}\text{Ca}_x\text{MnO}_3$ is comparable to that of Gd [15,16]. These

compounds exhibit large magnetic entropy change (ΔS_M) and relative cooling power (RCP) near room temperature due to the paramagnetic (PM)–ferromagnetic (FM) phase transition at the Curie temperatures T_C , justifying their potential use as magnetic refrigerants. Apart from the above-mentioned manganites, the MCE of the bilayered perovskite manganites $\text{La}_{2-2x}\text{Ca}_{1+2x}\text{Mn}_2\text{O}_7$ have also been studied extensively [17–19]. In 2002, Zhu et al. reported a large magnetic entropy change of 16.8 J/kg K for $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ for a field change of 0–5 T, which allows magnetic refrigeration at room temperature [19]. Hereafter, there are a lot of literatures to repeat this work [17,18]. Although that the samples have the same nominal compositions, but the phase transition temperature and magnetic entropy change values are completely different. In order to eliminate this doubt, we prepared $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ compound. Moreover, the substitution of Eu for La may enhance the magnetization of the compound, which is necessary to obtain large magnetocaloric effect. However, there were reports that T_C was reduced by the substitution of magnetic rare earth atom for La [20]. It was reported that the doping of Sr could shift T_C toward high temperature [18]. Therefore, in the present work, we report the magnetic properties and magnetocaloric effect of $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ and $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$.

2. Experiments

Bulk $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ sample and $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$ sample were prepared by the conventional solid-state reaction

perovskite structure in a similar magnetic transition temperature range under the same field change, such as $\text{La}_{0.9}\text{Na}_{0.1}\text{MnO}_3$ (1.53 J/kg K around 218 K for 0–1 T) [23], $\text{La}_{0.880}\text{Na}_{0.999}\text{Mn}_{0.977}\text{O}_3$ (1.52 J/kg K around 220 K for 0–1 T) [24], $\text{La}_{0.75}\text{Na}_{0.25}\text{MnO}_3$ (4.7 J/kg K around 224 K for 0–1.5 T) [25], $\text{La}_{0.5}\text{Nd}_{0.2}\text{Ca}_{0.3}\text{MnO}_3$ (2.31 J/kg K around 213 K for 0–1 T) [26], $\text{La}_{0.65}\text{Nd}_{0.05}\text{Ca}_{0.3}\text{Mn}_{0.9}\text{Cr}_{0.1}\text{O}_3$ (0.96 J/kg K around 218 K for 0–1 T) [27], $\text{Pr}_{0.7}\text{Pb}_{0.3}\text{MnO}_3$ (1.35 J/kg K around 225 K for 0–1.35 T) [28] and $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ (2.28 J/kg K around 215 K for 0–1 T) [18].

Fig. 5. Magnetic entropy change as a function of temperature for $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ and $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$ under typical magnetic field changes.

Besides the ΔS_M , the RCP is another important parameter that characterizes the refrigerant efficiency of the material. In the present work the value of RCP is calculated by using

$$\text{RCP} = -\Delta S_{\text{Max}} \times \delta T_{\text{FWHM}},$$

where ΔS_{Max} represents the maximum magnetic entropy change and δT_{FWHM} its full-width at half-maximum. For a field change of 0–2 T, the RCP value of $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ and $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$ are 56.5 and 104.7 J/kg, respectively. They are increased to 151.8 and 240.4 J/kg for a field change of 0–5 T. Therefore, the perovskite manganese oxide $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$ can be considered to

be a good candidate material for use as active elements in magnetic refrigeration.

$\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ compound is often fabricated by the sol–gel or solid–state reaction methods [17–19]. Although many $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ compounds sintered at various temperatures exhibit the $\text{Sr}_3\text{Ti}_2\text{O}_7$ -type structure, they display different lattice parameters (a and c). The change of c/a ratio means a variation of Jahn–Teller (J–T) distortion [18]. The coupling of FM ordering and J–T distortion may determine the degree of first-order phase transition, phase transition temperature and saturated magnetization. The structural parameters determined from the XRD pattern (see Fig. 1), Curie temperature, and magnetic entropy change of the present $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ compound are compared with those in literatures [17,19], as shown in Table 1. One can find that high T_C and large ΔS_M could be obtained when the c/a ratio displays an appropriate value. The c/a ratio for the present compound is 4.9886, which lies between 4.9870 and 4.9893 [17], so we obtain middle values of T_C and ΔS_M , which may be due to the intermediate level of the J–T distortion.

4. Conclusions

In summary, from the magnetization measurements it is found that both $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ and $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$ compounds undergo a first-order ferromagnetic–paramagnetic phase transition around their respective Curie temperatures (235 K and 215 K, respectively). The substitutions of Eu for La and Sr for Ca for $\text{La}_{1.4}\text{Ca}_{1.6}\text{Mn}_2\text{O}_7$ induce the change of crystalline structure and the improvement of magnetization. Therefore, $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$ shows large magnetocaloric effect. For a field change of 0–5 T, the peak value of ΔS_M and RCP reach $7.1 \text{ J kg}^{-1} \text{ K}^{-1}$ and 240.4 J/kg , respectively. Large ΔS_M and high RCP as well as scarcely any hysteresis loss make $\text{La}_{1.3}\text{Eu}_{0.1}\text{Sr}_{0.05}\text{Ca}_{1.55}\text{Mn}_2\text{O}_7$ compound a promising candidate for magnetic refrigeration.
